Python's Attributes

Carl Friedrich Bolz, David Schneider
Dynamische Programmiersprachen
Heinrich-Heine-Universität Düsseldorf
Sommersemester 2010

Reminder

a message send consists of two steps:

- ▶ lookup the message implementation
- ▶ activate (i.e. call) the method that was found in this way

those are done in one step, not visible to the programmer

Attributes

in Python, those steps are separated in the language:

```
obj.method(argument_1, ..., argument_n)
```

is identical to:

```
m = obj.method
m(argument_1, ..., argument_n)
```

Bound methods
